

Are your E911 endpoints compliant with RAY BAUM'S ACT?

Imagine first responders pulling up to a large complex with only a street address to find a 911 caller?

The introduction of collaboration tools and softphones, brought on by hybrid and mobile working, has made it challenging for first responders to locate someone calling 911. Your organization must deliver the dispatchable location to the public safety answering point (PSAP) with any 911 call, including those from Multi-Line Telephone System (MLTS)

Let Sangoma Carrier Voice Address This For You

Our 911 Dynamic Location Routing Services allow for full address details to be sent at the time a call is placed, providing specific location details (e.g. Room #, Floor, Suite, etc) as well as allowing calls from nomadic users that find themselves in multiple locations.
